Challenges:

- Characteristics of biological systems
- Quantifying and minimising classification uncertainty

Progress:

- Understanding sources of uncertainty
- Reducing measurement error
- Designing more efficient monitoring networks

Prospects:

- Integration of modelling and monitoring to classify water bodies more reliably

Challenges

Challenges

- High inherent spatial and temporal variability
- Often significant measurement error
- High cost of monitoring → limited coverage and small sample sizes

variability + small sample sizes =
uncertainty in classification result (EQR) →
risk of mis-classification

Why worry about mis-classification?

- Knowing the risk of mis-classification allows us to manage the risks of:
 - failing to act because a water body has been wrongly reported as better than it is, or
 - wasting resources on water bodies that have been wrongly classed as worse than they are.
- Strategically, this allows managers to prioritise programmes of measures to improve status and where to focus future monitoring effort
- **Understanding and quantifying uncertainty is more important than a point estimate of status**

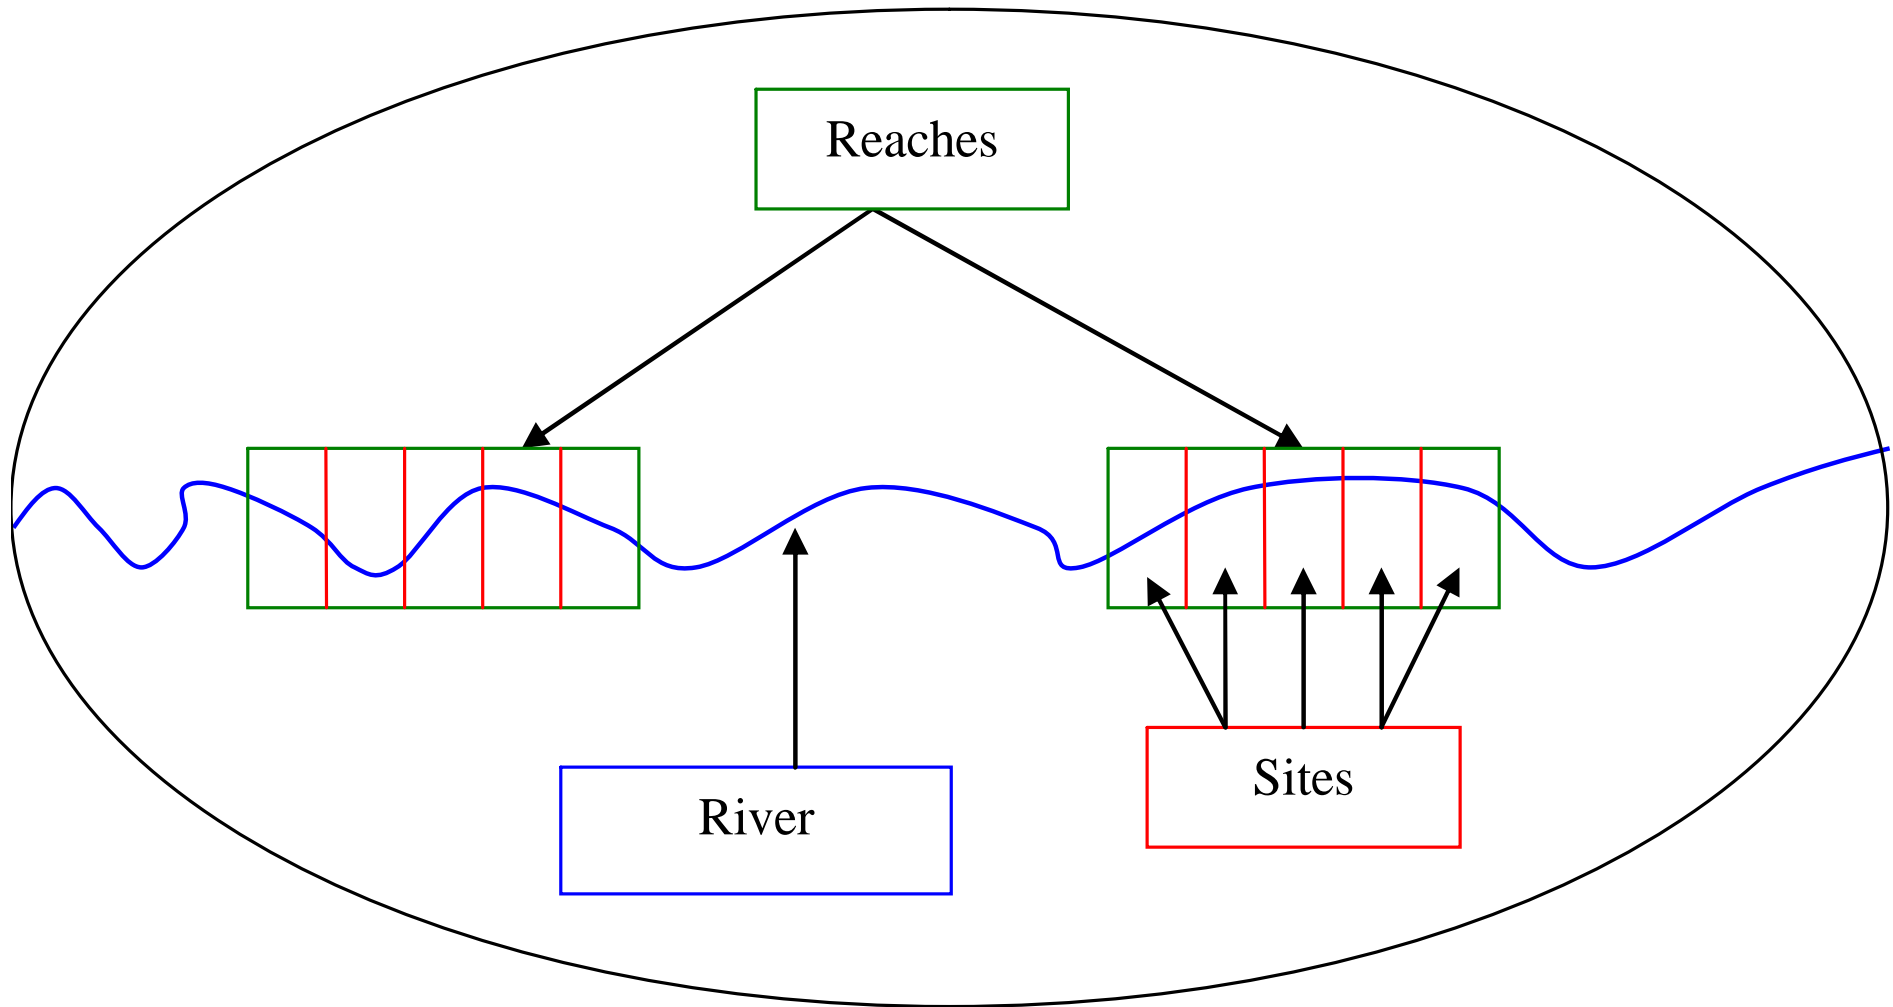

Progress

Understanding sources of variation

- **Spatial variation**
 - Among rivers, among water bodies, within water bodies
- **Temporal variation**
 - Among year, among month, within month
- **Operator variation**
 - Measurement error

Quantifying sources of variation

Quantifying sources of variation

% variation in NTAXA

- River
- Reach (500 m)
- Site (100 m)
- Month
- Operator

% variation in EQR

- River
- Reach (500 m)
- Site (100 m)
- Month
- Operator

Monthly surveys of riverine macrophytes in 10 rivers in England, Wales and Scotland. Surveys of replicate 5x100m sites performed in replicate reaches.

REML analysis of two metrics: NTAXA and overall EQR

Reducing measurement error

- More rigorous and frequent training and accreditation of operators
- More consistent use of appropriate equipment (e.g. waders, snorkels)
- Better adherence to current monitoring protocols
- Development and use of clearer monitoring protocols
- Employing pairs of operators instead of lone operators

Optimising the sampling strategy

A series of trade-offs:

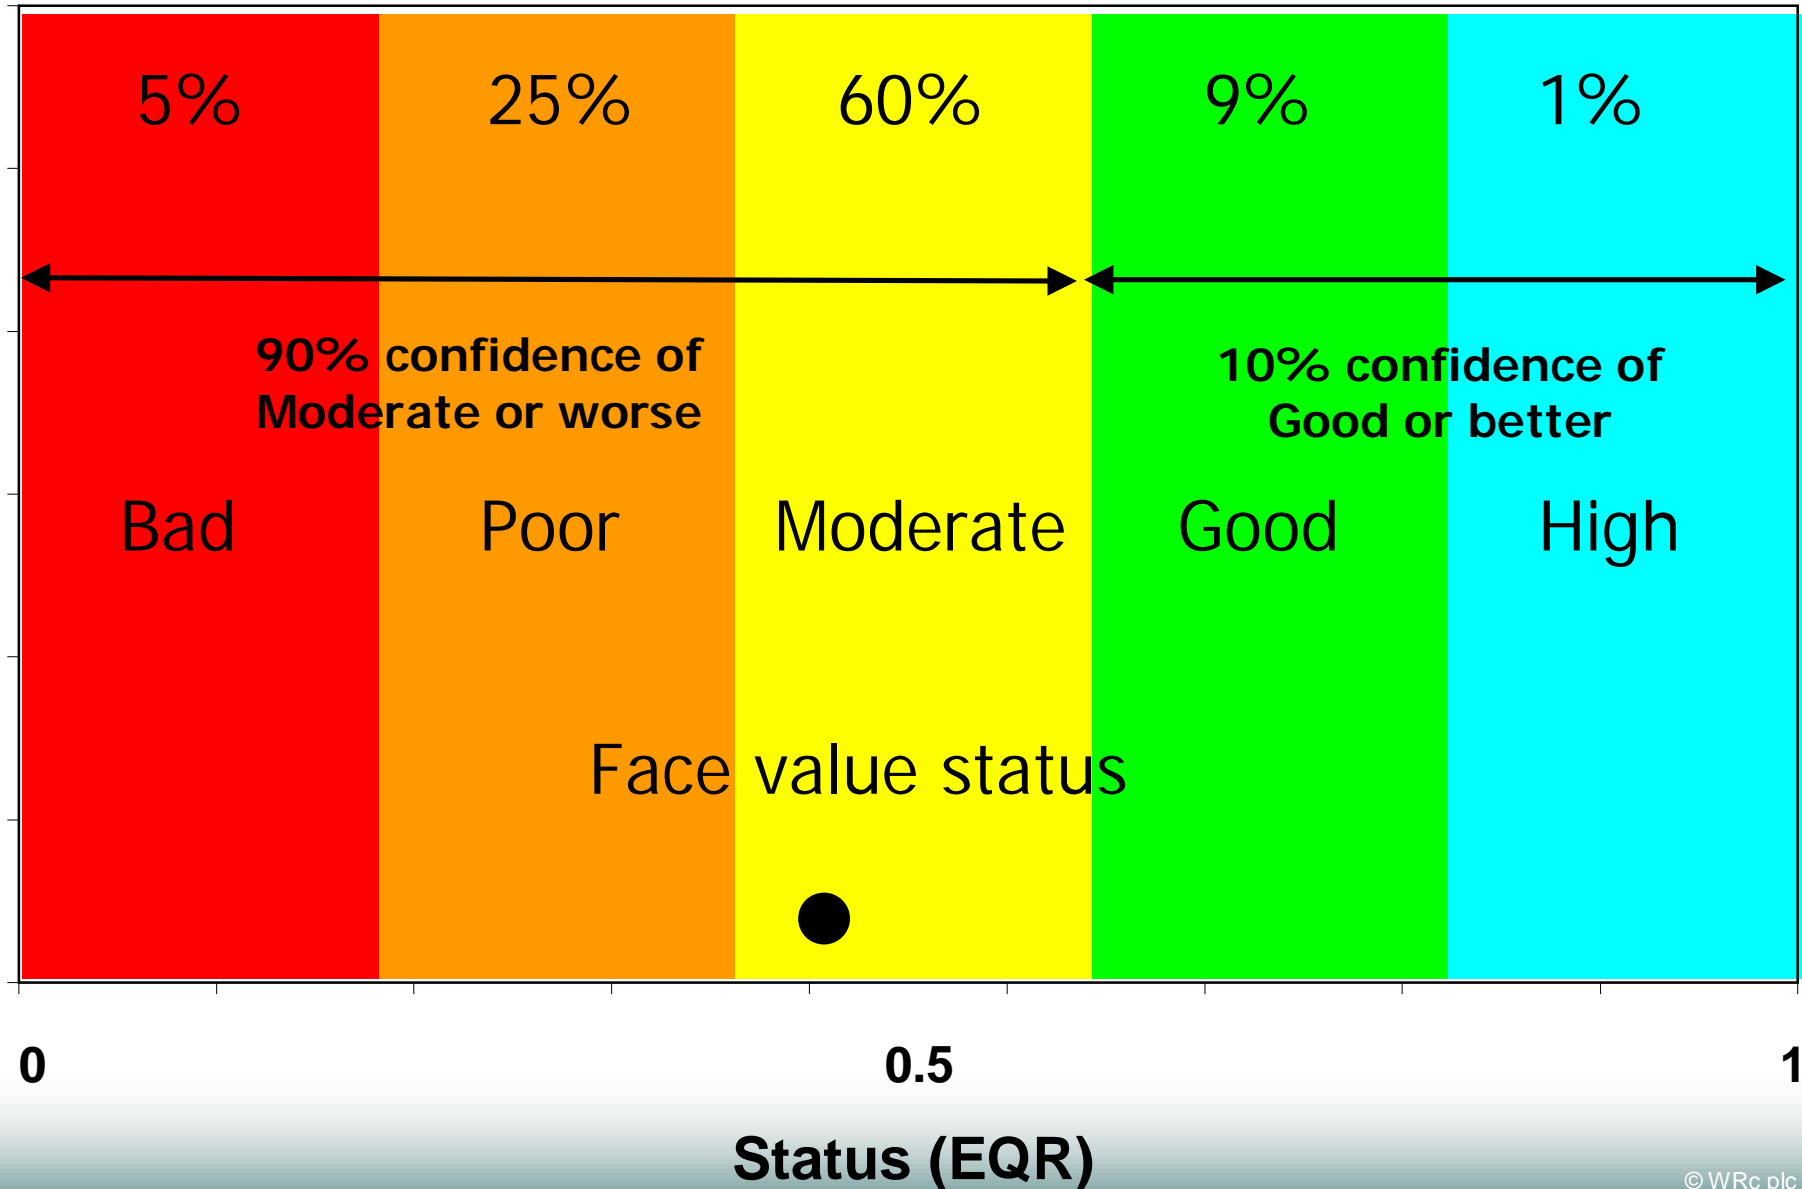

- **Spatial:** More 100m sites or more 500m reaches?
- **Temporal:** More months or more years?
- **Spatial vs temporal:** Emphasis on spatial or temporal coverage?

	Reach1	Reach2	Reach3
Year1	X		
Year2			X
Year3		X	

	Reach1	Reach2	Reach3
Year1		X	
Year2		X	
Year3		X	

	Reach1	Reach2	Reach3

Hierarchical model of spatial variation

Information needs (2)

Geostatistical models of spatial variation

Four steps to reducing uncertainty

1. Understand and quantify sources of variation
2. Minimise measurement error
3. Optimise sampling strategy and sampling effort
4. Integrate monitoring data with modelled predictions

“If you know, to recognize that you know;
if you don't know, to realize that you don't know:
that is knowledge.” - *Confucius*
